CIVIL ENGINEERING

Tony Skinner, Program Coordinator: RMIT has got a reputation for producing a top grade of student, the reason for that is mainly the quality of the program, the quality of the staff. All our staff have been employed in industry at some stage of their career, so in coming to RMIT, they are getting a good intensive program. We do work the students hard, we make no apologies for that and that’s why we’ve got the reputation for having a high quality program.

George Newman, RMIT Student: Its very practical, we cover a lot of facets of the industry, you do save two years of HECS fees, which is a big benefit if you look at it in the long term. The fact that RMIT offers this articulation program, you’re not wasting two years of your life, you’re actually going into third year uni, you’re still doing a four year degree. I don’t think you’re less well off, in fact I think you are better off doing it this way!

Student: RMIT is a very practical course, its very hands on, compared to other courses that I researched before. You spend at least once a week in the lab, which I found a lot better than sitting in the classroom from time to time, it gives you the chance to explore different options.

Student: If you look around you, just about everything around you has been designed by a civil engineer in one way or another, so the job prospects are limitless really. Infrastructure, its all based on work done by civil engineers, so you are never going to want for work, ever.
